As part of the ongoing development of Rally Tracking for all Motorsport Ireland permitted rallies, we have identified a challenge that will require the cooperation of all competitors moving forward. Currently, we utilise the 4Rally System with built-in batteries to operate the tracker during all rallies, and this has served us well thus far.

However, in our pursuit of improved performance, it has become clear that during multi-day events, the units require reaching maximum battery capacity. As such, it is necessary to take action to address this issue.

Effective June 1st 2026, all cars participating in multi day stage rallies (more than 1 day) must install a power lead to supply power to the tracker unit.

We fully recognise that the installation of these leads **(which will be provided free of charge)** will require time. Therefore, distribution will commence at all upcoming events, or the power leads can be posted upon request.

While the first rally for which this measure will be mandatory is the Donegal International Rally, we would greatly appreciate it if as many installations as possible could be completed beforehand.

Thank you for your cooperation and understanding as we work to enhance our rally tracking capabilities.
